Description	Evaluation	Likelihood	Impact Level	Responsibility	Response	Control Measure
The database goes down/No connection	Whole application will not work as no connection	Possible	High	SQL/Developers (Depends on how)	Either wait till its back online or check connections	Maintain connection by providing personnel for this
The Database gets hacked and alters the table	Pre-coded information no longer works and it'll constantly be	Low	High	Developers/Cyber Security	Gain access back to the database and restore it as well as make it more secure	Secure database more(Secure password)
Added code is not compatible with the others	This will create errors which would not allow the code to run	High	Medium	Testers/Developers	Locate the problematic code and try make it compatible with code that works	Create Test before creating new code so you know future problems
Not sanitised input	Input inputted is incorrect therefore it is not submitted into the query properly	High	Low	Developers/User	Either create something that catches invalid input but lets them retry or user should be careful when inputting	Try and catches so it does not throw an exception and ruin programme
